

Use Patchomator with Installomator

In Jamf Pro first and foremost **add the Installomator script** to the Settings > Computer Management > Scripts - Can be downloaded from GitHub: <https://github.com/Installomator/Installomator>

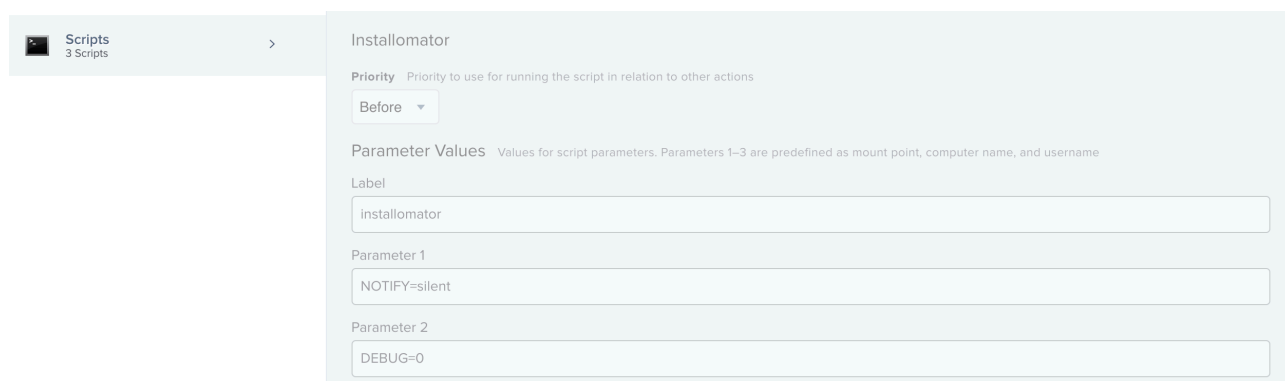

Create (self service) policies for the apps you want to install via Installomator (this optional for Patchomator usage).

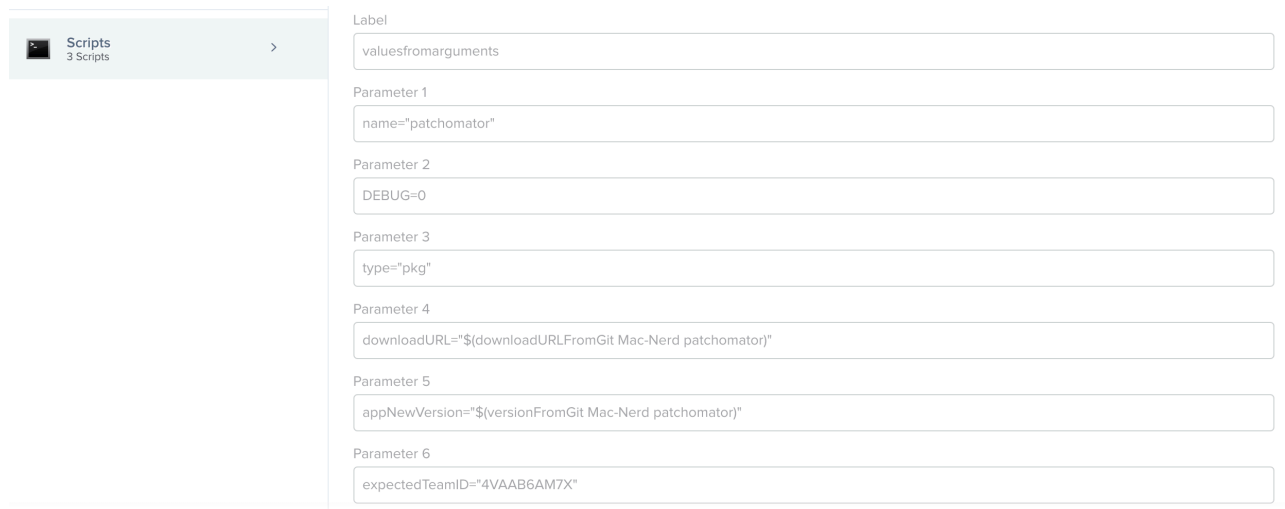

Create a Patchomator policy (either make it available in Self Service or set it to run at a set time) with 3 payloads:

1. Install Installomator locally (via Installomator):

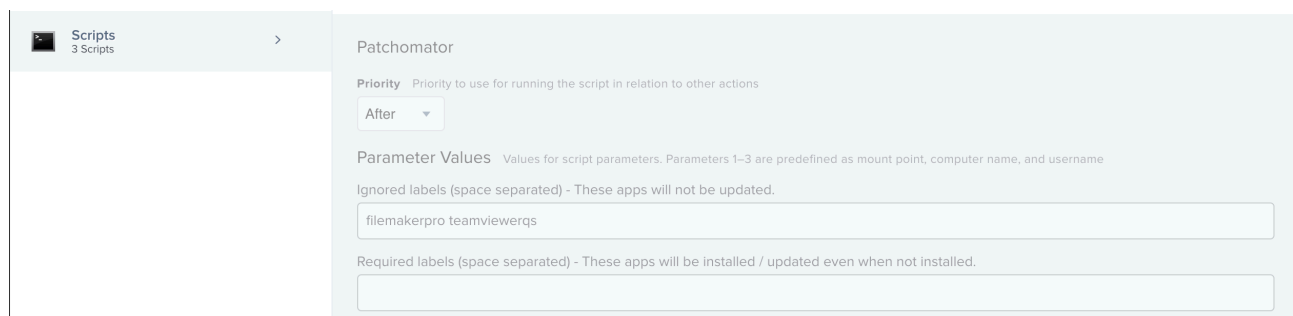

2. Install Patchomator (via Installomator or PKG, is currently a manual Installomator label).

The screenshot shows the 'Scripts' section of a configuration window. On the left, a sidebar lists 'Scripts' with '3 Scripts' below it. The main area displays the configuration for a script named 'Patchomator'. The configuration includes a 'Label' field with the value 'valuesfromarguments', and six 'Parameter' fields with the following values: 'name="patchomator"', 'DEBUG=0', 'type="pkg"', 'downloadURL="\$(downloadURLFromGit Mac-Nerd patchomator)"', 'appNewVersion="\$(versionFromGit Mac-Nerd patchomator)"', and 'expectedTeamID="4VAAB6AM7X"'.

Field	Value
Label	valuesfromarguments
Parameter 1	name="patchomator"
Parameter 2	DEBUG=0
Parameter 3	type="pkg"
Parameter 4	downloadURL="\$(downloadURLFromGit Mac-Nerd patchomator)"
Parameter 5	appNewVersion="\$(versionFromGit Mac-Nerd patchomator)"
Parameter 6	expectedTeamID="4VAAB6AM7X"

3. Add the Patchomator execution script and add ignored / required labels as needed:

The screenshot shows the 'Patchomator' configuration window. The 'Priority' dropdown is set to 'After'. The 'Parameter Values' section is empty. The 'Ignored labels (space separated) - These apps will not be updated.' section contains the text 'filemakerpro teamviewerqs'. The 'Required labels (space separated) - These apps will be installed / updated even when not installed.' section is empty.

Field	Value
Priority	After
Parameter Values	
Ignored labels (space separated) - These apps will not be updated.	filemakerpro teamviewerqs
Required labels (space separated) - These apps will be installed / updated even when not installed.	

When run Patchomator will match all applications that are in the /Applications folder with available Installomator labels. If a label is available it will check for newer app versions. If a new version is available it will install it through Installomator.

Be aware this could take some time especially if there's a lot of apps.
